

7-Day Reset for Men 35+

General wellness education only. Not medical advice. Always speak to your GP or a qualified health professional before changing exercise, diet, sleep routines or supplements, especially if you have a condition or take medication. Stop and seek advice if you feel pain, dizziness or chest discomfort.

From Steady Mind 35 · youtube.com/@steadymind35 · Strong body, steady mind after 35.

Who this is for

Busy men over 35 who want a simple week of habits for energy, movement, sleep and steadier mood. No gym required. No extreme diets. No hormone or supplement protocols.

How to use it

- Pick any Monday (or tomorrow) and follow one short action per day.
- Aim for "good enough", not perfect. Miss a day? Continue the next one.
- Keep notes in your phone: energy 1–5, sleep quality 1–5, mood 1–5.

Day 1 — Sleep window

Action (10 min setup): Choose a fixed wake time for the next 7 days. Set a "screens off" alarm 45 minutes before your target bedtime.
Why: A steady sleep window is one of the most reliable lifestyle levers for next-day energy.
Optional stretch: Dim lights after the screens-off alarm. Keep the bedroom cool and dark.
Skip if: Your GP or sleep clinician has given you a different plan. Follow that instead.

Day 2 — Daylight and a short walk

Action (10–15 min): Get outside within 2 hours of waking for daylight and a gentle walk. No pace targets.
Why: Morning light and light movement help clock your day and break long sitting blocks.
Optional stretch: Take calls while walking when you can.
Skip / modify if: Mobility limits or outdoor access is hard. Stand by a bright window and march gently in place for 5 minutes instead. Check with your GP if you are new to walking for exercise.

Day 3 — Strength basics (bodyweight)

Action (10 min): Two rounds, easy pace:
1. Sit-to-stand from a chair × 8
2. Wall push-ups × 8
3. Hip hinge (hands on hips, soft knees, push hips back) × 8
4. March in place × 30 seconds

Rest as needed. Stop if anything hurts sharply.
Why: Strength work supports everyday capacity as you age. Keep it beginner-level.
Check first: New to exercise, joint pain, heart or blood-pressure concerns? Speak to your GP before starting.

Day 4 — Protein-forward plate (no meal plan)

Action: At your main meal, build the plate as: palm-sized protein (eggs, fish, chicken, beans, tofu, Greek yoghurt), a fist of veg or fruit, and a cupped hand of carbs you already eat.
Why: A simple plate template is easier to stick with than a restrictive diet.
Not this week: No calorie counting, no "detox", no cutting out food groups unless a clinician advised it.

Day 5 — Stress downshift (10 minutes)

Action: Set a timer for 10 minutes. Sit or walk slowly. Breathe in for 4, out for 6. If thoughts race, name three things you can see.
Why: Short downshifts are a practical way to interrupt all-day tension.
If you are struggling: You are not alone. In the UK, Samaritans are free on 116 123 (24/7) or https://www.samaritans.org/. Men can also contact CALM (https://www.calm.org.uk/). For urgent mental-health help: https://www.nhs.uk/nhs-services/mental-health-services/where-to-get-urgent-help-for-mental-health/. If life is at risk, call 999. Outside the UK, use your local emergency number or crisis line (US: call or text 988).

Day 6 — Mobility for stiffness (not a "fix")

Action (5–6 min): Slow circles and ranges you already have:
1. Ankle circles × 5 each way, each foot
2. Gentle hip openers (knee to side while standing, hold chair) × 5 each side
3. Shoulder rolls × 8
4. Cat-cow on all fours or seated spine flexion/extension × 6

No forcing. Mild stretch is fine. Sharp pain is a stop signal.
If you have injury or ongoing pain: See a GP or physiotherapist rather than pushing through.

Day 7 — Review and one keep-habit

Action (15 min): Look at your 1–5 notes. Circle one habit from this week that felt doable. Schedule it three times next week in your calendar.
Optional: Text one trusted person that you are keeping that habit (accountability without oversharing health details).

What this guide does not do

- Diagnose conditions or interpret symptoms
- Recommend testosterone, TRT, SARMs, peptides or "boosters"
- Promise fat loss, muscle gain or mental-health outcomes
- Replace NHS care, physiotherapy or therapy

Keep going
